Also see the Macintosh version of Photoshop. Overview Photoshop is a raster graphics image editor and painting tool originally created by

Adobe Systems. Like many image editors, Photoshop does not use a drawing program's layering system. Instead, Photoshop works by projecting an image onto an irregular grid of pixels, and the user is free to manipulate the pixels within the grid into any shape. Images are represented

as flat objects with
bounding boxes.

Adobe Systems
produces versions of
Photoshop for the
Macintosh, for
Windows, for the
UNIX platform, and
for Internet Explorer.
Versions of Photoshop
for the Web are
available for the
Macintosh and for
Windows. For 3D

modelling and animation, the company's programs also include After Effects, Flash, Illustrator, and Premiere Pro.

Photoshop's layered editing features (like those used in drawing programs) are rarely used in Photoshop, because it can make the editing process

much more
complicated.

Photoshop uses a
raster-based system,
which represents
objects and areas in
the image as a grid of
pixels. Photoshop has
multiple editing tools
and features,
including: Using
layers, Photoshop
enables users to work
on a complex image as

a series of overlapping layers. Each layer contains an object or area, and the user can cut or paste the layers on and off to change the image. Using masks and filters, Photoshop enables users to selectively display certain objects or areas on an image. In Photoshop's free-hand mode, users can

select parts of the image and mask or paint them away. Add-ons and plug-ins Photoshop Plug-ins may be created by Adobe developers; or they may be third-party companies offering plug-ins; or they may be written by users of Photoshop. These are a few plug-ins available in

Photoshop that you may find useful. Add-ons can be extensions of Photoshop, something that makes your file more powerful or easier to use, or just tools.

Q: When does URL receiving post request in ASP.NET MVC? I am trying to understand, where to perform post request in ASP.NET MVC, where I do not want to be redirected to any controller, to specific action method. For example I need to

make a request to
where I do not want to
be redirected to
UsersController. Also,
I have a theory - does
MVC app server
compile Razor views
on every request or
not? UPDATE This is
the route I have
currently:

```
routes.MapRoute(  
name: "Default", url: "  
{controller}/{action}/
```

{id}", defaults: new {
controller = "Home",
action = "Index", id =
UrlParameter.Optional
}); where.NET MVC
(I use in
RouteConfig.cs)
doesn't recognize
index. I have action in
the controller with
another name, where I
simply call Post
method, like so:
[HttpPost] public

ActionResult

```
example(string text) {  
return View(); } I am
```

unsure, whether my route simply executes since is the URL, when I call POST method, or whether my ASP.NET MVC module "forgot" to execute this action method. A: The answer to your question is "Wherever you want to be".

ASP.NET MVC is intended to be as flexible as possible. You are free to use it how you want. In an ASP.NET MVC application, you have full control over the entire request cycle from: Handling the HTTP request
Creating the MVC controller action
Invoking the

controller's action
method Handling the
results of the controller
action If your action is
something like a
"login" action that
requires some special
processing that is not
present in the default
model, the decision is
up to you what to do.
But if you follow
ASP.NET MVC
conventions, you will

be able to leverage all
of the power of
ASP.NET MVC.

Q: Disable animation
on anchor? I'm using
CSS3 and this is what I
have so far: JSFiddle I
want this to be a click
event... it doesn't have
to animate though. I
just want the screen to
snap left or right.
